

Netted Communications

Bringing together multiple communications methods for instant and secure voice collaboration across dispersed land, sea & air based assets.

Looking for a voice collaboration platform that brings together landline, radio and mobile users simultaneously?

Need to broadcast critical information to remotely dispersed individuals in an instant over a secure private network?

Wish to utilise over-the-horizon communications via satellite for dispatch and conferencing needs?

Organisations conducting mission critical operations in areas with restricted radio service availability (often in “harsh” terrains), need robust and reliable voice collaboration solutions.

Our netted voice approach brings together a variety of communication methods from different areas into a “net” which can be easily managed from many locations. We facilitate real-time information sharing, decision-making and response co-ordination wherever operatives are located.

Sectors served include:

- Military operations
- Homeland security
- Disaster management
- Maritime
- Non government organisations
- Energy
- Transportation
- Mining
- Utilities

The Speakerbus solution

Speakerbus offers a range of commercially off-the-shelf solutions that provide the ability to connect dispersed individuals across multiple communications networks. Whatever your specific mission critical voice collaboration need, we offer solutions of different scales that work effectively in highly challenging environments.

Key benefits

- Commercially available off-the-shelf application, requiring less long-term investment in design, upgrades and maintenance than a bespoke application.
- High availability and reliability of real-time communications on a 24/7 basis in even the most extreme environments.
- Ease of operation and minimal user training required with many functionalities accessible by just "one-touch".
- Built with resilience and disaster recovery capabilities to ensure no disruption to mission critical operations occurs in unforeseen circumstances.
- Centralised management of multiple devices using a standard web browser.
- The choice to utilise a non-terrestrial means of communication in the event of terrestrial services being unavailable.
- Capability to monitor and combine different radio frequencies with traditional communications mediums e.g. PSTN & GSM.

Key features

Our portfolio of Netted Voice solutions delivers a range of mission critical communications capabilities including:

- "One talk, multiple listen" with no distance restriction over a private voice network
- Prioritise inbound calls, held calls and lines in use
- Instantly bring together groups of users at a touch of a button
- Interoperate with existing communications platforms
- Operator profiles are constantly synchronised, such that operators can move to a new location with no service interruption
- Host private communication between a group of remote users and the control room
- Access to multiple communications networks including:
 - Multi-channel radio circuits
 - Satellite communications as a transport medium
 - IP/SIP, digital or analogue telephone circuits
 - Public address systems
